EXECUTIVE BOARD AGENDA ITEM

AFT, as presently designed, is a system which will enable communicators overseas to handle more traffic because the system will perform functions presently done manually by the operators.

To be discussed are the potential additional work saving attributes of a system such as AFT. Can the system be sophisticated to a point where the COMCENTER can be unattended during periods of operation. What will it cost to provide such a system?

Put another way, can AFT be used to help us accommodate possible future overseas personnel cuts?

What problems do unattended operation present? Can we solve them?
